

Cold Chain Stability Guide

Synthetic fixture only. This guide is not a clinical or commercial release authorization.

Shipment CT-204 disposition rule

Shipment CT-204 contains a refrigerated study product with an approved transport range of 2 C to 8 C. If a single temperature excursion remains above 8 C for no more than 45 cumulative minutes and the peak stays below 12 C, quarantine the shipment while telemetry is reconciled. A pharmacist may release it only after confirming sensor identity, calibration status, duration, and peak temperature.

Reject CT-204 if the excursion exceeds 45 cumulative minutes, reaches 12 C or higher, has an unresolved sensor-identity mismatch, or lacks a valid calibration record. Record the evidence and reviewer identity with the final disposition.

Evidence handling

Use the telemetry record for duration and peak values. Do not infer missing readings. Cite the stability-rule chunk and the telemetry chunk when explaining a disposition.
